 **SOLIDWORKS**

## Subdivision Modeling

Use freeform sculpting to generate complex shapes and surfaces

## Soft Selection

Extend the influence of the manipulator proportionally to sculpt a larger area

## Net Surface

Create a subdivision surface from existing sketches or curves

## Reflect

Generate an editable, symmetrical copy of your subdivision surface

## Subdivision Alignment Tools

Align subdivision entities to each other, or to additional sketches and model geometry

## Working Zone

Define the area of the mesh that can be edited in a subdivision surface

## Copy & Paste Subdivision

Duplicate a subdivision surface

## Advanced Surface Views

Sculpt while viewing the normal surface, the subdivision cage, or from a section view

### **System Status**

Ensure a strong server connection

Specify the high performance graphics processing unit (GPU)

### **Failure Identification**

Visual feedback locating failure points of features including thicken, fillet, and chamfer

### **Print3D**

Prepare models for additive manufacturing in a custom, virtual build volume

Support and layer visualization

### **Smart Mates**

Drag and drop components to automatically apply mates

### **Selective Save**

Choose which subassemblies and components to save

### **Lock Status**

Lock models to avoid concurrent changes by multiple users

## Algorithmic Design

Combine visual scripting and 3D modeling

## Voronoi Operator

Partition an existing surface using Voronoi algorithm

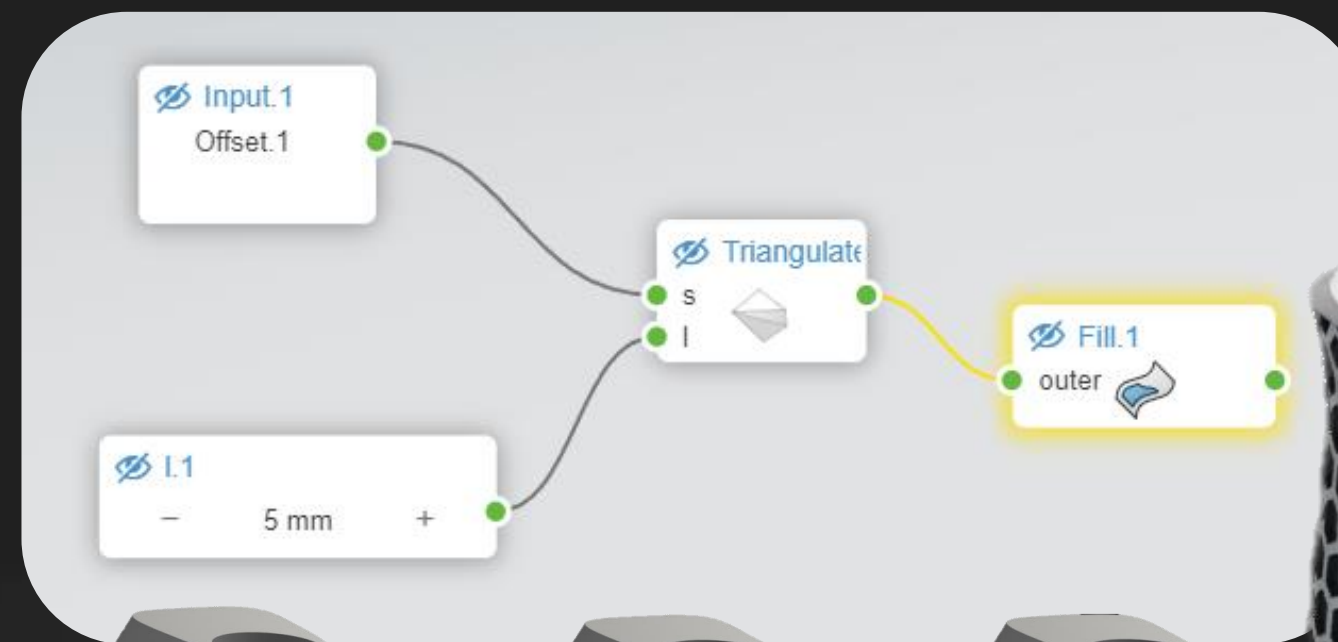

## Parametric Operators

Perform algorithmic design with familiar commands such as “thicken”, “add” boolean, “split” and more

## Integration with xApps

Switch between design apps like xDesign and xShape to update original geometry

xGenerative patterns will automatically fit to the updated model

# Lattice Design

## Lattice Design Application

Lightweight components while retaining structural integrity

## Lattice Design Assistant

Integrated step-by-step guide to select part, cavity, and lattice type

## Lattice Structure Options

Create your own or choose from a selection of pre-loaded lattice cell Structure Systems

Lattice cells are editable in size, thickness and orientation

ergonomic and does not give users a comfortable ride. The current crankarm design needs an updated look with similar strength and weight characteristics compared to the original.

molding with better ergonomics, using the attached industrial design sketches. We also need a new handle design. Finally, redesign the crankarm based on the comments above. The new crank arm let's plan to use some lattice structure to minimize weight.

**Handle & Crank Arm Upd...**

      - Subdivision Surface.1

A 3D coordinate system icon is located in the top right corner of the interface. It features three axes: a red X-axis, a green Y-axis, and a blue Z-axis. Below the axes is a dropdown menu currently set to 'mm'.
